Farm Waste Management Plan

This plan identifies how 'chemical' wastes such as surplus crop protection products, plastic containers and similar wastes are managed on the farm. These can cause serious pollution problems and must be disposed of carefully and certainly in accordance with The Agricultural Waste Regulations 2006 and relevant Codes of Practice. A simple and positive step for any farm is to complete a farm waste management plan. This identifies the types of waste encountered on the farm and how they should be disposed of.

Type of Waste Material	Chemical Name/Components (if applicable)	Method of Disposal / recycling

Where applicable more specific advice is provided on disposal of sheep dip in Appendix EC13a.
